VEDD.AI · FREE SOUND TOOLS

Real sound for Claude-made videos

Claude can animate well, but the sound it writes for you is usually a handful of synthesized beeps. These three free tools fix that. Openverse gives it real recordings, Real SFX places them on the exact frame, and earshot lets it listen and check the mix.

1 Openverse: 5.2 million free audio files, no key

A free search engine for openly licensed media, with a public API. On Oct 29, 2026 it listed **5,223,435** audio files: 3,986,828 from Wikimedia Commons, 644,709 from Jamendo and 591,898 from Freesound. That count includes music as well as sound effects.

How Claude uses it

- Search: `GET https://api.openverse.org/v1/audio/?q=whoosh&license=cc0`
- No key and no account. Anonymous use is rate-limited (about 20 searches a minute and 200 a day when we checked).
- Each result has a direct file URL, the creator and the licence.

Licences, read this

- **CC0**: free for any use, no credit needed. Filter with `license=cc0`.
- **CC BY**: free, but you must credit the creator.
- CC BY-NC: non-commercial only. Skip it for client work and ads.

PASTE INTO CLAUDE CODE

```
Use the Openverse API (https://api.openverse.org/v1/audio/, no key needed) to find CC0 sound effects for this video: a whoosh for scene cuts, a soft pop for cards appearing, a UI click, a deep impact for the big reveal, and a short notification chime. For each one, search with license=cc0, pick 3 short options (under 2 seconds), download them into ./sfx, and write sfx/credits.json with the title, creator, licence and source URL of every file.
```

2 Real SFX: a real recording on the exact frame

A free Claude Code skill from Clipwing. It finds the moments in your video that need a sound, from a cue list, a HyperFrames timeline or the picture itself, and puts a recording from your own library on each one. Your music and voiceover stay, and the effects duck under the voice. If the render already has synthesized effects baked in, it removes them instead of doubling them.

Setup

- Needs Python 3.9+ and FFmpeg on your PATH.
- Copy `skills/real-sfx` from github.com/Clipwing/skills to `~/.claude/skills/real-sfx` and restart Claude Code.
- Run its setup script and point it at your sound library (the README has the exact command). It can add 78 free CC0 UI sounds to start.

Use it

- Ask: `Add sound design to this render.`
- You get a new MP4, the effects as a separate WAV for Premiere or After Effects, and a report of which sound went where.
- It scores sync, balance and loudness, then names five moments to check by ear.

Pairs with Openverse: the skill brings no whooshes, hits or foley of its own beyond the UI sounds. Fill your library with CC0 sounds from step 1, then point Real SFX at that folder.

3 earshot: ears for Claude

An open-source toolkit (MIT, runs on CPU) that lets a coding agent hear audio. It turns sound into evidence Claude can reason about, and it can also build new sounds in code. It works as a CLI, a Python library or an MCP server, so Claude Code can call it directly.

Listen and review

- `describe` , `match` , `rank` , `find` : what a file sounds like and how well it fits a description.
- `timeline` : a second-by-second listening transcript of your film.
- `critique` : a scorecard with timestamped fixes.
  `measure` : loudness and timing with no models.

Make sound

- `forge` : writes a new sound as code, scores each take and keeps the best.
- `sfx` : renders from a built-in bank of 252 sounds, offline.
- `kit init / render / check` : a full sound kit for one film, with calm, crisp, minimal and launch presets.

INSTALL (FROM THE README)

```
git clone https://github.com/Leonxlnx/earshot && cd earshot
python -m venv .venv
.venv/bin/python -m pip install torch --index-url https://download.pytorch.org/whl/cpu
.venv/bin/python -m pip install -e ".[mcp,llm,dev]"
.venv/bin/python -m earshot doctor --load
```

Needs Python 3.10+ and ffmpeg. The first run downloads about 1.1 GB of open models, then it works offline. It is reliable for loudness, timing, sync to picture and single exposed sounds. It cannot judge taste or emotion, so still watch the final cut once with sound.

The workflow we use

1. **1.** Render the video with a cue list: every scene change, card, number and reveal, with its time.
2. **2.** Fill a library with CC0 recordings from Openverse: whooshes, pops, clicks, impacts, risers, chimes, paper.
3. **3.** Let Real SFX place a recording on every cue, ducked under the voice.
4. **4.** Run earshot's `critique` and `measure` on the result. Fix anything late or too loud.
5. **5.** If nothing in the library fits a moment, have earshot `forge` a new sound for it.

PROMPT FOR THE WHOLE THING

This video needs real sound design. 1) Read the cue list in cues.json. 2) For any cue type we have no sound for, find 3 CC0 options on the Openverse API and save them to ./sfx with credits. 3) Use the real-sfx skill to place one recording on every cue, ducked under the voiceover, and give me the new MP4, the SFX WAV and the report. 4) Run earshot critique and measure on the result and fix anything more than 2 frames off or louder than the voice.
